About Lilia Roo

- Furry since 2018
- Wrote transformation stories!
- Software engineer
- Graduated 2023, but been employed in industry for 5+ years
- Cut teeth via small FOSS contributions beforehand
- Maintainer of sewifurs.org since 2021
- Maintainer of Xfburn since 2022
- Developer for Weasyl since 2024

Problem statement

Online-only
games, or beloved
versions of them,
will go defunct...

...but we can
bring them back
through *science*!

Outline

Using an example project:

- Decompilation
 - Renaming symbols
 - Cross-reference code with fan documentation
 - Reverse engineering the network protocol
 - Writing our new server!
- 

Before you begin!

Every project is different

- Different programming languages
- Different libraries
- Some games are obfuscated
- Some games hate debuggers
- Some games have anti-cheat
- Does fan-written documentation exist?

Our example project

Neopets Mobile

- J2ME, 2006 – 2009
- Developer: In-Fusio
- Could sync progress with main website
- Only way to access Lutari Island!

Lutari Island

Decompilation!

- Used Vineflower (formerly Quiltflower)
- Bytecode → Source
- Symbols are obfuscated :(
- This obfuscation uses normally-invalid duplicate names!

```
public final class p {  
    public int a;  
    private ByteArrayOutputStream a;  
    private ByteArrayOutputStream b;  
    private DataOutputStream a;  
    private ByteArrayOutputStream c;  
    private DataOutputStream b;  
  
    public p(int var1) throws IOException {  
        this.a = var1;  
        this.a = new ByteArrayOutputStream();  
        this.b = new ByteArrayOutputStream();  
        this.a = new DataOutputStream(this.a);  
        this.a(m.a + ";" + "2.8");  
    }  
  
    public final int a() {  
        return 2 + this.a.size() + this.b.size();  
    }  
}
```

Decompilation!

- Ask decompiler to assign everything a unique name instead
- The exact flag depends on your tools
- Easier to work with!

```
// $QF: renamed from: p
public final class class_2 {
    // $QF: renamed from: a int
    public int field_12;
    // $QF: renamed from: a java.io.ByteArrayOutputStream
    private ByteArrayOutputStream field_13;
    // $QF: renamed from: b java.io.ByteArrayOutputStream
    private ByteArrayOutputStream field_14;
    // $QF: renamed from: a java.io.DataOutputStream
    private DataOutputStream field_15;
    // $QF: renamed from: c java.io.ByteArrayOutputStream
    private ByteArrayOutputStream field_16;
    // $QF: renamed from: b java.io.DataOutputStream
    private DataOutputStream field_17;

    public class_2(int var1) throws IOException {
        this.field_12 = var1;
        this.field_13 = new ByteArrayOutputStream();
        this.field_14 = new ByteArrayOutputStream();
        this.field_15 = new DataOutputStream(this.field_13);
        this.method_37(class_17.field_154 + ";" + "2.8");
    }
}
```

Starting renaming

I gotta figure these out? Where do I even begin?

- Look for literal strings in functions
 - Mid-method log messages can help greatly
- Look for short, 'leaf' functions
 - Can more easily give a name based on what it does
- Look for recognizable constants
 - Check the game's wiki; maybe it's a value for a mechanic

Starting renaming

```
// $QF: renamed from: a () void
public final void method_79() {
    if (this.field_76 != 0) {
        this.field_77 = 0;
        this.field_75 = 0;
        class_8.method_67(this.field_84, 0);
        class_8.field_63 = 0;
        this.field_84.field_58 = 0;
        Thread var1 = new Thread(this);

        try {
            var1.start();
        } catch (Exception var3) {
        }
    }
}
```

```
// $QF: renamed from: a () void
public final void startLoadingImages() {
    if (this.loadingImageCount != 0) {
        this.loadedImageCount = 0;
        this.loadingImageId = 0;
        ImageLoader.setLoadedImages(this.parent1, 0);
        ImageLoader.loadErrorCount = 0;
        this.parent1.bytesLoaded = 0;
        Thread thread = new Thread(this);

        try {
            thread.start();
        } catch (Exception e) {
        }
    }
}
```

It's like a puzzle, and you're solving it piece-by-piece

Fan documentation helps!

Course Type	Level Range	# Codestones	Duration
Grasshoper	20 and below	1	2 hours
Basic	21-40	2	3 hours
Intermediate	41-80	3	4 hours
Adept	81-100	4	6 hours
Advanced	101-120	5	8 hours
Expert	121-150	6	12 hours
Master	151-200	7	18 hours
Grand Master	201-250	8	24 hours

Mystery Island Training School guide
From Jellyneo

```
if (activePetLevel <= 20) {  
    trainingTimeLeft = 7200000L;  
    trainingCost = 1;  
} else if (activePetLevel <= 40) {  
    trainingTimeLeft = 10800000L;  
    trainingCost = 2;  
} else if (activePetLevel <= 80) {  
    trainingTimeLeft = 14400000L;  
    trainingCost = 3;  
} else if (activePetLevel <= 100) {  
    trainingTimeLeft = 21600000L;  
    trainingCost = 4;  
} else if (activePetLevel <= 120) {  
    trainingTimeLeft = 28800000L;  
    trainingCost = 5;  
} else if (activePetLevel <= 150) {  
    trainingTimeLeft = 43200000L;  
    trainingCost = 6;  
} else if (activePetLevel <= 200) {  
    trainingTimeLeft = 64800000L;  
    trainingCost = 7;  
}
```

Now we can give names to these!

Networking

- Search for URLs, IP addresses, etc.
 - Depending on the game, might be read from a config file, might be hardcoded
- Search for socket read/write
 - Depends on language, libraries, etc.
- Look at the call stack and referenced classes
- You found the networking code!

Networking

```
private static void callApi(int requestId, String var1) throws Exception {  
    StructuredWriter writer = null;  
    Object var3 = null;  
    ServerApi.initialize(11061, 61, gameName, language, "http://npprod-singtel.in-fusio.com/data-np/");  
    if (requestTypeId >= 8) {  
        ServerApi.setPhoneNumber("+12345556789");  
    }  
  
    switch(requestTypeId) {  
        case 1:
```

This game has a hardcoded endpoint

What now?

- Need to figure out how the protocol works
 - Is it HTTP? Raw TCP? Raw UDP?
 - Is it synchronous request-response? Something else?
 - Is there a separate auth step?
 - What is the data format?
- Study the decompilation for a bit, taking notes
- To get a real sample, create a simple server that just reads from the socket and logs requests

Basic server quick notes

- If the game hits a specific domain, route that to 127.0.0.1 via your hosts file
 - Unix-ish systems: `/etc/hosts`
 - Windows:
`%WINDIR%\System32\drivers\etc\hosts`
 - Use your favorite programming language
- 

Example network protocol

- HTTP, single endpoint
- Requests have plaintext headers, URI-encoded
- Actual body is in a custom binary format
- Each type of request or response has a 16-bit 'tag'
 - For requests, this is the desired function
 - For responses, this is the meaning of the contents
- Has a buffer of numbers (byte/short/int), then strings
 - Items read in sequential order
 - A short in the number buffer can be an offset pointer in the string buffer
 - Type information not encoded

Structured data format

Following some plaintext headers...

Offset	Type	Meaning
0	short	Tag
2	int	Length-derived value: $8 * (2 + n + m)$
6	short	number buffer len + 2 (n)
8	bytes	number buffer
n + 8	bytes	string buffer
m	short	0x00FF, end of structured data

Note that if tag == 0x8000 or 0x8064, a different format is followed:

Offset	Type	Meaning
0	short	Tag
2	int	$(\text{len}(\text{message}) + 1) * 8$
6	byte	0x00, start of message
7	string	error message to display in console

From my notes at: https://computers.huntertur.net/index.php/Neopets_Mobile

Example: Login request

```
00000000: 636c 6965 6e74 3d4e 454f 5045 5453 2f32 client=NEOPETS/2
00000010: 2e38 2667 616d 653d 3131 3036 3126 6365 .8&game=11061&ce
00000020: 6e74 6572 3d36 3126 6c61 6e67 7561 6765 nter=61&language
00000030: 3d65 6e0a a001 0000 01a0 0012 0000 0000 =en.....
00000040: 0040 0000 0040 0010 0018 0020 000e 4953 .@...@..... ..IS
00000050: 4f2d 3838 3539 2d31 3b32 2e38 0006 6164 0-8859-1;2.8..ad
00000060: 6164 6164 0006 676a 676a 676a 0000 00ff adad..gjpggj....
```

Login request:

Username: adadad

Password: gjgjpgj

Example: Login request

00000000:	636c 6965 6e74 3d4e 454f 5045 5453 2f32	client=NEOPETS/2
00000010:	2e38 2667 616d 653d 3131 3036 3126 6365	.8&game=11061&ce
00000020:	6e74 6572 3d36 3126 6c61 6e67 7561 6765	nter=61&language
00000030:	3d65 6e0a a001 0000 01a0 0012 0000 0000	=en.....
00000040:	0040 0000 0040 0010 0018 0020 000e 4953	.@...@.....IS
00000050:	4f2d 3838 3539 2d31 3b32 2e38 0006 6164	0-8859-1;2.8..ad
00000060:	6164 6164 0006 676a 676a 676a 0000 00ff	adad..gjpgjgjj...

Headers: client = NEOPETS/2.8, game = 11061, center = 61, language = en

Tag: 0xa001 Length-based value: 416 (= 8 * (2 + 50))

Number buffer len + 2: 18 Number buffer: (16 bytes)

String buffer: (34 bytes) End of data: 0x00ff

Example: Login request

Number buffer:

0000 0000 0040 0000 0040 0010 0018 0020
(unused constants)

String buffer:

00 0e ISO-8859-1;2.8
00 06 adadad
00 06 gjgjgj
00 00

- Offset to encoding string
- Unused constant
- Unused constant
- Offset to username
- Offset to password
- Unused offset to blank string

Developers aren't perfect!

Don't stress about unused or constant values

Sending our first response

- Take a look over what you've discovered so far
- What's the easiest thing to implement first?
 - Always returning a game-recognized error on login?
- Goal: Make the client do something other than show a generic network error
 - This proves we figured out the basic interface of the API

Generic network error

Example: Error response

0aa0 0000 0000 4000 0800 0000 2900 0000 ff

Headers: None (newline-terminated)

Taa: 40960 (0xA000) (sync status)

Length-derived value: 64 ($= 8 * (2 + 6 + 0)$)

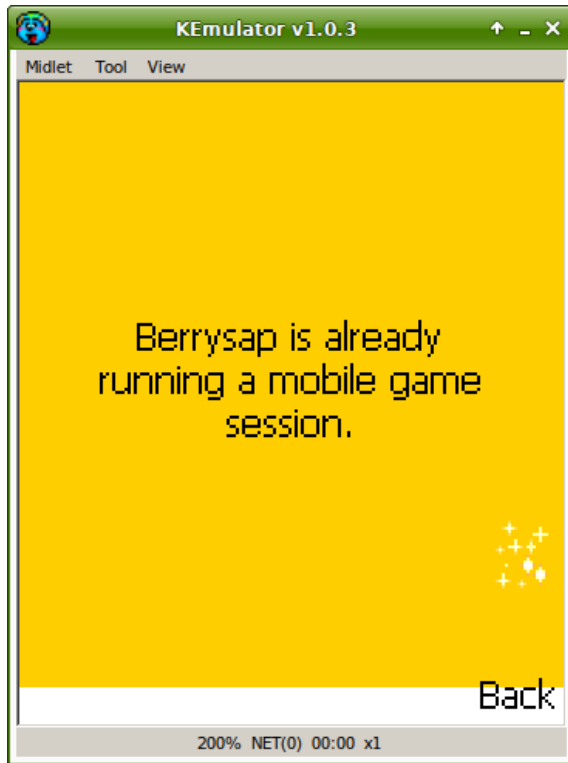

Number buffer len + 2: 8

Number buffer: 41 (int), pointer to blank string
(41 → user already logged in)

String buffer: just a blank string, so nothing

End of data: 0x00FF

Game recognized error

- Even if we semantically responded with an error, the response itself is valid.
- Therefore, it's working!

Building out the server

- It's alive!
- Keep analyzing code and renaming symbols to understand other API calls' interfaces
- 80/20 rule: you'll likely get 80% of the client functional by implementing 20% of the API
- Don't worry about data persistence while prototyping

Client debugging can suck

What next!

- Data persistence
 - Let people truly create accounts
 - Store their game state on disk

Don't let your work go to waste!

Even if you don't finish, people would love to see what you uncovered!

- Any data specs, even partial, help immensely
 - Future people could reference your notes!
 - Found unused stuff? Share with tcrf.net
 - Consider open-sourcing your new server
- 

Thanks for coming!
